Adios Platform

Change and Update Report

Covers the work done across the six projects in the repository: the backend API, the customer app, the driver app, the Food Partner app, the admin panel and the public partner website.

Written for: the project owner and the team who will review, test and deploy these changes.

1. Summary

~290	6	56	270
files changed or added	projects touched	bug-sheet items fixed (of 68 in scope)	automated tests passing

Work was driven by a 193-item bug and requirements sheet. Items 1 to 50 (customer and driver apps) and 176 to 193 (Food Partner app, admin and support) were worked on. Items 51 to 175 were not part of this round. In addition to the sheet, several improvements were made on request: a new Home layout, rotating search hints, a working fare-raise feature, better place search, delivery codes for food and meat orders, and fixes to partner sign-in and password reset.

Project	Files touched	Main changes
backend	57	Account deletion, accurate search, place search, partner meat items, offers, analytics, invoice links, audit log, support tools, broadcasts, reports, fleet map
app (customer)	144	Splash, language screen, Home redesign, search bar, cart tab, fare raise, legal pages, delete account, OTP removal, UI and accessibility fixes
driver	12	Decline without reasons, package-delivery wording, delivery code for food and meat
Food-Partner	43	Meat items, profile and cover images, status bar, push handling, analytics, offers, invoices
admin	34	Audit log, broadcasts, reports, fleet map, canned replies, ticket priority and notes, permissions
frontend	1	Environment example file corrected

Verification status

- Automated checks pass: backend 65 tests, Food Partner 97 tests (plus translation key check), admin 5 tests, customer app 103 tests. Type checks and lint are clean for every file that was changed. The admin type check still reports four errors in files that were not touched, and the backend lint reports 22 older errors in files unrelated to this work.
- The customer-app fixes for items 006, 008, 010, 012, 015, 017, 020, 025, the package-delivery wording and fare, the food cancel flow, the fare-raise card, the cart tab and the new Home layout were checked on an Android emulator.

- The new backend endpoints for items 176 to 193 were exercised against a running backend and a real database (permissions, audit trail, SLA clock, offers, analytics, reports). The Food Partner and admin screens built for them were checked by type check, lint and unit tests, but **have not been opened on a device or in a browser**.
- Nothing has been tested on a real phone for the earlier customer-app items. A device pass is recommended before release.

2. Bug sheet items 1 to 50 (customer and driver apps)

Out of 50 items, 38 are fixed. 2 are partly fixed, 3 could not be reproduced, 5 were skipped on request (one of them, 005, was later done) and 2 are code-quality work that was not started.

Accounts and sign-in

Item	What changed
001	Delete account added (Account, then Delete account). It asks for the password, saves a complete safety copy of the user's data first, then anonymises the account and signs the user out. A script exports a saved copy when needed.
022, 026, 029	OTP sign-in removed from the customer app. Sign-in and sign-up use phone or email with a password only; the OTP screens, hooks and components were deleted.
031	Terms and Privacy Policy pages added with full text, linked from sign-up and from the Account tab.
018	Language selection screen redesigned. The splash screen stays in English.
030	New splash: an "A" mark, then the ADIOS wordmark. Wording that said "Project X" now says Adios, including the welcome text. The native splash image changes only after a new store build.

Home, search and food

Item	What changed
016	Home search bar restyled; its border turns orange when focused, and tapping it opens the keyboard.
009	Menu search is accurate: every typed word must match. Searching "chicken biryani" returns only dishes with both words; "tea" no longer returns "steak".
006	The cuisine strip keeps one selection at a time.
012	Home carousel cards now show their real promo text and open Offers.
019	Auto is shown as "Up to 3 people", with a note on the ride confirmation screen.
010	A long restaurant email now fits inside its card.
017	My Orders filter shows one order type at a time (Food or Meat).
020	Cart opens like the other screens. It was later moved into the bottom tab bar on request.
025	The "Order from... again" button was removed from the empty cart.
040	The meat top bar no longer shows a hard-coded place name.

Food orders (item 013 and 008)

- Closed restaurants are greyed out and cannot be opened or favourited.
- A food order shows "Waiting for restaurant to confirm your order" instead of "Finding your rider".
- The cancel sheet on food orders uses food wording ("Cancel order / Keep order") instead of ride wording.
- After the restaurant and a driver accept, the footer shows Order details and Cancel order instead of Help.
- The driver app can decline an offer in one tap, with no list of reasons (the reason list was removed).

Rides, package delivery and helper

Item	What changed
015	"Where to?" highlights Pickup first, then moves to Drop.
043	The route chip on the ride confirmation screen no longer overlaps the buttons on phones with a notch.
044	A working fare-raise card was built on the "finding driver" screen with +₹10, +₹20, +₹30 and +₹50 options. The faded pills in the old screen were on a screen nothing opens.
023	Package delivery wording corrected throughout (customer and driver apps); the price on the booking screen now equals the price on the finding screen; the "null min" banner and a stuck-screen bug were fixed.
028	Fare mismatch fixed: the fare estimate now uses the real route distance.
005	Originally skipped, then done on request. See the new Home layout in section 4.

UI and accessibility audit (033 to 050)

Item	What changed
033, 039	Maps follow the dark theme in the ride flow and the map picker.
034	Chat screen: removed the empty band under the input.
035	Checkout: the keyboard no longer covers the promo or tip field.
036, 037, 041, 045	Filter modal, Home service tiles, payment bill card and cart strip are fully translated (English, Telugu, Hindi), with correct item counts.
038, 047, 048, 049, 050	Larger tap areas and screen-reader labels on the sticky header, the ₹149 store buttons, the "use current location" icon (text translated) and the delivery back buttons.
042	Personal details: the Update button rises with the keyboard.
046	Support chat scrolls to new messages.
004	Console logging is stripped from release builds of the apps and the admin build. Backend logs are kept. Logs still appear in development builds.

Not changed in this round

Item	Status	Reason
011, 014	Not reproduced	Hire a Helper works in the current code; if it fails in production, that server is running an older version.
027	Not reproduced	No gap above the restaurant filters with the test data; a screenshot is needed.
007, 021, 024, 032	Skipped	Skipped on request (food and meat redirect, meat cancel wording, payment screen restyle, 3D service images).
002, 003	Not started	Automated test and CI setup; replacing about 1,200 loose type annotations in the customer app.
023, 028 (rest)	Partly done	Open: package weight field, details and cancel after a partner is assigned, blocking a booking when no partners are nearby, share and emergency buttons, and the remaining ride-flow points.

3. Bug sheet items 176 to 193 (Food Partner, admin and support)

Seventeen of the eighteen items were built. Item 180 needed no change and item 181 (receipt and kitchen-ticket printing) was skipped on request.

Food Partner app

Item	Status	What changed
176 Meat	Done	Meat partners can add, edit, delete and stock-toggle their own items with photo, category, description, price and weight. The five standard items keep their name and category but can change price, photo and stock. New items appear to customers through the existing meat menu. New backend endpoints and checks enforce ownership.
177 Images	Done	Profile picture and cover image can be taken or picked, cropped, uploaded with a loading state and clear errors, and are saved on the outlet. The cover image field is new on the restaurant and meat-centre records.
178 Status bar	Done	On the dashboard, account and login screens the status-bar gap moved to the screen frame so content never scrolls underneath it.
179 Push	Done	Kept the Expo push service (which delivers through Firebase on Android). Taps now open the right screen for new orders, scheduled requests, order updates, payouts, support replies and announcements. Announcement targets are limited to an allow-list. A "Send test notification" row in Account, backed by a new endpoint, lets a partner verify delivery.
180 Bank	No change	The screen already shows the partner's own account from the backend (last four digits and IFSC) with no placeholder data. Changing details still goes through support.
181 Printing	Skipped	Skipped on request; it would need a native Bluetooth printer module.
182 Analytics	Done	New Sales analytics screen: revenue, delivered orders, average order, cancellations and rate, a daily chart and top-selling dishes over 7, 30 or 90 days. Days are counted in India time.
183 Invoices	Done	Finished orders show an Invoice row that opens the invoice in the browser through a signed link valid for 10 minutes, where it can be printed or saved as a PDF.
184 Offers	Done	New Offers screen: partners create, pause and delete their own discount codes (percentage or flat, minimum order, expiry). Limits: up to 50 percent or ₹500, at most 10 active offers, unique codes. Customers already see outlet offers at checkout.

Admin panel

Item	Status	What changed
185 Audit log	Done	Every successful admin or support write (blocking, verification, refunds, payouts, pricing, coupons, zones and more) is recorded with who, what, target, the values before and after, and the request with secrets removed. Records cannot be edited or deleted. New Audit log page with filters and detail view.
186 Tests	Done	New tests for payout status mapping, audit-log helpers, support SLA and permissions, CSV safety, vendor analytics, offer limits, notification routing and admin helpers.

187 Dashboard	Done	A live fleet map shows every online driver (free in green, on a job in orange) with counts and orders searching for a driver, refreshing every 15 seconds from real positions.
188 Broadcast	Done	New Push broadcast page: send to customers, drivers, partners or everyone. Admin only, short messages, one broadcast every 30 seconds, a confirmation step, and a history of every send.
189 Exports	Done	New Reports page exports orders, drivers, customers and vendors as CSV with an optional date range. Each download is written to the audit log.

Support tools

Item	Status	What changed
190 Canned replies	Done	A shared library of replies that staff insert into either reply box, with the customer's first name filled in. People with the permission can add, edit and delete them.
191 Tickets	Done	Tickets have a priority (low, normal, high, urgent), a first-reply timer and a resolution timer with due-soon and breached states, and private internal notes. Customers and drivers never receive priority, timers or notes.
192 Export and metrics	Done	A metrics bar shows open cases, average first reply and resolution times, SLA breaches and each agent's backlog, plus a ticket CSV export (audited).
193 Permissions	Done	Admins set what each support member may do: reply, resolve and reopen, change priority, write notes, cancel orders, export, manage canned replies. Existing members keep their previous abilities; the new export and canned-reply management start switched off. The server enforces every permission.

4. Other changes made on request

Change	Details
New Home layout	Package delivery and Helper were removed from the Rides area and now sit on the Home screen as their own services, in place of the old Task area. Home tiles: Food and Meat, Ride, and a Package and Helper pair. The sticky header has Food/Meat, Ride, Package and Helper buttons. The all-services screen now lists only Bike and Auto.
Search hints	The Home search bar text rotates every two seconds through at least three suggestions, changes for Food and Meat, and is vertically centred.
Ride icons	The Ride tile uses auto, bike and car icons.
Place suggestions	Address search now finds small places such as a town's bus stand. The backend asks Google first, then adds Google's geocoder and the OpenStreetMap services, also trying other spellings (for example "busstand" as "bus station" and "Tadepalligudem" as "Tadepallegudem"), then merges results without repeats. Unit-tested.
Delivery code for food and meat	Food and meat deliveries now need the customer's 4-digit delivery code to complete, like package and helper orders. The code is hidden from the driver. Rides still finish without a code. This reverses the earlier removal of the code for food and meat.
Fare raise	If no driver accepts, the customer can add ₹10, ₹20, ₹30 or ₹50 from the finding screen for rides and package deliveries.
Cart as a tab	Cart moved into the bottom tab bar like the other main screens.
Partner sign-in and password reset	Reset-password lookups for restaurants and meat centres now ignore upper and lower case, and the backend logs when no account matches an email. The Food Partner app's API address was pointed at the backend's actual port.

5. Backend changes in detail

New and changed endpoints

Endpoint	Purpose
`POST/PUT/DELETE /meat/items`	Partner-owned meat items (create, edit, remove)
`PUT /vendors/me`	Now also saves the cover image
`GET /vendors/me/analytics`	Sales analytics for the signed-in outlet
`GET/POST /vendors/me/offers`, `PUT .../:id/active`, `DELETE .../:id`	Partner offers
`POST /vendors/me/test-push`	Test notification to the partner's own devices
`POST /orders/:id/invoice-link`, `GET /orders/:id/invoice/view`	Short-lived signed invoice link

`GET /admin/audit-logs`	Read-only audit trail
`GET /admin/fleet`	Live driver positions
`GET /admin/reports/:kind`	CSV exports (orders, drivers, users, vendors)
`GET/POST /admin/broadcasts`	Push announcements and their history
`/admin/canned-replies` (list, create, edit, delete)	Canned replies
`POST /admin/tickets/:id/notes`	Internal notes
`GET /admin/tickets/export`, `GET /admin/tickets/metrics`	Ticket CSV and metrics
`GET /admin/me/permissions`, `GET /admin/support-permissions`, `PUT /admin/support-members/:id/permissions`	Support permissions
`DELETE /users/me`	Account deletion with a full safety copy
`GET /places/autocomplete`	Multi-source place search with spelling variants
`PATCH /orders/:id/status`	Delivery code now required for food and meat; support cancel needs a permission

New data and shared pieces

- **New records:** admin audit log (append-only), canned replies, broadcasts, deleted-account archive.
- **Extended records:** support ticket (priority, first-reply and resolved times, private notes), user (support permissions), vendor and meat centre (cover image), meat item (description).
- **Request layer:** one middleware records admin and support writes across the whole API, with secrets removed and sizes capped.
- **Search:** menu search ranking and matching rules, and the place-search helpers, are separate tested modules.
- **Pricing:** the fare estimate now uses the real route.
- **Scripts:** export of a deleted account's saved copy and a local test-driver helper.

6. Customer app, driver app and tooling

- **Customer app:** new splash and language screens; legal pages; delete account; OTP screens removed; Home tiles, sticky header, rotating search hints and search overlay; cart as a tab; fare-raise card; food cancel flow; dark map style; larger tap areas; Telugu and Hindi strings added throughout.
- **Driver app:** decline without reasons; package-delivery wording ("Package Delivery Task", "Package Delivered!"); the delivery code field for food and meat orders.
- **Build tooling:** the Metro and Vite configurations strip console output from release builds; one environment example file was corrected.

7. Deployment and follow-up notes

> **The production server must be updated before the new features work.** A check of the production API showed the new partner analytics route does not exist yet. Until the backend is deployed, these will fail: sales analytics, offers, invoice links, test notification, meat item add/edit/delete, saving profile and cover images, and every new admin page.

- Deploy the backend first, then release the apps. The Food Partner app needs no new native build for these changes; the customer app's native splash image needs a store build.
- The new audit log, canned replies, broadcasts and extra ticket fields are created automatically on first use; no manual migration is required.
- Hindi and Telugu text for the new screens was written during this work and should be reviewed by a native speaker. The new admin pages show English in Hindi and Telugu until their keys are added.
- The places service still carries a hard-coded Google Maps key as a fallback. It should be moved to the environment file and the key rotated. The new fleet map reuses the key fallback the admin panel already has.
- Admin members who need to export tickets or manage canned replies must be granted those permissions.
- Recommended next work: the open package-delivery and ride items, a real-device test pass, and the code-quality items 002 and 003.
